

I am a curious and analytical problem-solver who enjoys understanding how systems and technologies work at a deeper level. I'm naturally drawn to breaking down complex problems into smaller pieces and iterating toward clear, logical solutions. Whether I'm debugging code, learning a new framework, or approaching an unfamiliar challenge, I tend to focus on understanding the underlying structure rather than just finding a quick fix.

I value both independence and collaboration in my work. I enjoy taking ownership of problems and pushing through challenges on my own, but I also appreciate working in teams where ideas are shared openly and solutions are refined through discussion. My experiences in research, team-based projects, and industry roles have reinforced that I do my best work in environments where I can both contribute and learn from others.

Across my experiences training machine learning models, building projects, and working on real-world systems at Amazon, I've developed a strong sense of curiosity and adaptability. I'm motivated by opportunities to improve my skills, take on new challenges, and apply what I learn to meaningful problems. Overall, I see myself as someone who is constantly learning, refining my thinking, and striving to become a stronger engineer over time.
