

I want to build and improve large-scale systems that make complex technology more reliable, efficient, and understandable. My interests lie at the intersection of systems, data, and machine learning, particularly in designing tools that provide visibility into how systems behave and perform. I'm especially interested in problems where understanding system behavior through metrics, debugging, and thoughtful design leads directly to better performance and more reliable outcomes.

Through my experience at Amazon, I've seen how better instrumentation and well-designed evaluation systems can transform how teams understand and improve their products. Working on AI-driven workflows showed me that even powerful systems need strong infrastructure around them to be effective, and that careful engineering can make a meaningful difference in real-world performance. I want to continue working on systems where data and engineering come together to drive better decisions and more robust solutions.

In the future, I hope to contribute to high-performance, data-driven systems in environments that value technical rigor, curiosity, and continuous learning. I am particularly drawn to roles where I can both build systems and deepen my understanding of how they work internally, allowing me to design solutions that are not only functional but also efficient and scalable.
